

## DATA SET DESCRIPTION

### Seasonal grids of monthly averaged daily minimum air temperature (2m) over Germany

#### Version v1.0

**Cite data set as:** DWD Climate Data Center (CDC): Seasonal grids of monthly averaged daily minimum air temperature (2m) over Germany, version v1.0, 2018.

#### INTENT OF THE DATASET

The grids are derived from DWD stations and legally and qualitatively equivalent partner stations in Germany run for climatological and climate related applications.

#### POINT OF CONTACT

Deutscher Wetterdienst  
CDC - Vertrieb Klima und Umwelt  
Frankfurter Straße 135  
63067 Offenbach  
Tel.: + 49 (0) 69 8062-4400  
Fax.: + 49 (0) 69 8062-4499  
Mail: [klima.vertrieb@dwd.de](mailto:klima.vertrieb@dwd.de)

#### DATA DESCRIPTION

<b>Spatial coverage</b>	Germany
<b>Temporal coverage</b>	01.03.1901 - last season
<b>Spatial resolution</b>	1 km x 1 km
<b>Temporal resolution</b>	seasonal
<b>Projection</b>	3-degree Gauss-Kruger zone 3, Ellipsoid Bessel, Datum Potsdam (central point Rauenberg), EPSG:31467, see <a href="http://spatialreference.org/ref/epsg/31467/">http://spatialreference.org/ref/epsg/31467/</a> . To define the spatial projection in GIS, the file <a href="https://opendata.dwd.de/climate_environment/CDC/help/gk3.prj">https://opendata.dwd.de/climate_environment/CDC/help/gk3.prj</a> can be used. Help is given on importing into ESRI ArcGIS in <a href="https://opendata.dwd.de/climate_environment/CDC/help/Hilfe_Gauss-Krueger-Raster2GIS.pdf">https://opendata.dwd.de/climate_environment/CDC/help/Hilfe_Gauss-Krueger-Raster2GIS.pdf</a> .
<b>Format(s)</b>	The file in ESRI-ascii-grid-format has in the header the coordinates for the lower left grid cell, including the definition of its center [XLLCENTER],[YLLCENTER] or its corner [XLLCORNER],[YLLCORNER]. It contains a table of 654 x 866 numbers. Each row goes from West to East. The first row is the northernmost one (654 values with 4 digits). Missing values are marked with -999.
<b>Parameters</b>	Seasonal mean of the monthly averaged minimum daily air temperature in 2 m height above ground, given in 1/10 °C.
<b>Uncertainties</b>	Uncertainties are caused by the interpolation method, and erroneous or missing observations. When comparing grid fields for different periods, it should be considered that the measurement network has changed over time.

#### DATA ORIGIN

The grids are based on the DWD station data [Kaspar et al., 2013]. The seasonal grid is the sum of the three monthly grids, in accordance with the WMO-Standard [WMO, 2012].

## VALIDATION AND UNCERTAINTY ESTIMATE

The given resolution of 1 km x 1 km is the resolution of the employed digital height model. The gridded data miss processes relevant for local climate (like urban heat island or cold air pools) which are not covered by observations of the station network or cannot be reproduced by the gridding method explained above. The actual information density depends on the station network. 1881 the monthly means of 150 stations were used in the gridding routines. The number of used stations grew steadily to 200 stations at the begin of the 20th century, and 400 before World War II. After the war, the number of stations decreased a short time, growing again to above 500 since 1951. Changes in station height caused by station relocations are accounted for with the interpolation to the reference height.
